Bibliographies in the Quick Bibliography Series of the National Agricultural Library, are intended primarily for current awareness, and as the title of the series implies, are not indepth exhaustive bibliographies on any given subject. However, the citations are a substantial resource for recent investigations on a given topic. They also serve the purpose of bringing the literature of agriculture to the interested user who, in many cases, could not access it by any other means. The bibliographies are derived from computerized on-line searches of the AGRICOLA data base. Timeliness of topic and evidence of extensive interest are the selection criteria.

The author/searcher determines the purpose, length, and search strategy of the Quick Bibliography. Information regarding these is available upon request from the author/searcher.

Copies of this bibliography may be made or used for distribution without prior approval. The inclusion or omission of a particular publication or citation may not be construed as endorsement or disapproval.

To request a copy of a bibliography in this series, send the title, series number and self-addressed gummed label to:

Logit analysis using data from a survey of Tulare County, California, farmers is used to examine computer and application ownership patterns in agriculture. The analysis indicates that the size of the farming operation, education level, age level, and the ownership of a farm-related nonfarming business significantly influence the probability of computer ownership; however, the type of farm products used on the farm does not. The type of application software owned is influenced primarily by the type of farm products produced, the size of the farming operation, ownership of a farm-related business, and the education level of the farmer.

Abstract: A whole-farm simulation analysis is used to investigate producer preferences for adoption of separate tillage practices (minimum-till, combination-till, or no-till) under provisions of both the 1981 and 1985 farm bills. An analysis of preference for participation or nonparticipation in government programs under both farm bills is also considered. For risk-averse producers, a combination-tillage practice with program participation is found to dominate (as measured by stochastic-dominance) the other strategies considered under both the 1981 and 1985 provisions.
